

Combined Self-operated Regulators

Regulators for Differential Pressure, Flow Rate and Temperature

Application

Regulators for district heating supply networks, heat generators, heat exchangers, building service plants and industrial plants. For safety monitoring and safety limitation of the energy supply in heat generators and heat exchangers.

Temperature set point from **0 to 120 °C** · Limit signals up to **120 °C** · Valves in **DN 15 to DN 50** · Nominal pressure **PN 25** · Suitable for liquids up to **150 °C** and gases up to **80 °C**

The valve closes when the differential pressure, flow rate or temperature increases.

Special features

- Low-maintenance P-regulators requiring no auxiliary energy
- Suitable for water and non-flammable liquids and gases, provided they do not cause the materials used to corrode
- Special version with oil-resistant internal parts
- Temperature sensor for operating pressures up to 40 bar
- Suitable for district heating plants conforming to DIN 4747 (requirements stipulated by AGFW (German District Heating Association) concerning components in house substations).

Combinations with Type 2403 K Safety Thermostat have the same function as a safety temperature monitor (STM) · With Type 2439 K Safety Thermostat, the same function as a safety temperature limiter (STL) · Regulators have "Extended Safety" specified in DIN 3440.

Versions (Figs. 1 and 2)

Differential pressure or flow regulators with temperature regulators in valve sizes DN 15 to DN 50 made of red brass with connection nuts and welding ends (special versions with threaded ends or flanges) · DN 32, 40 and 50 also available with flanged valve body made of spheroidal graphite iron · Type 2430 K Control Thermostat

Type 2468/2430 K · Differential pressure and temperature regulator with a fixed differential pressure set point adjusted to $\Delta p = 0.1$ or 0.2 bar · With internal overload protection (excess pressure limiter) in the actuator · Installation in return flow pipes

Type 2469/2430 K (Fig. 1) · Flow and temperature regulator with continuously adjustable flow set point at the integrated restriction (upper differential pressure of 0.2 bar) · Installation in either flow or return flow pipes

Type 2478/2430 K (Fig. 2) · Differential pressure and temperature regulator, same as Type 2468/2430 K, but for installation in flow pipes

Type 2479/2430 K · Differential pressure and temperature regulator with flow limitation · Fixed differential pressure set point adjusted to $\Delta p = 0.2$ bar · Continuously adjustable flow limitation · With internal overload protection (excess pressure limiter) in the actuator · Installation in return flow pipes

Type 2469/2430 K/2403 K Flow and Temperature Regulator and Safety Temperature Monitor (FR/TR/STM) · With Type 2469 Valve, Type 2430 K Control Thermostat and Type 2403 K Safety Thermostat

Fig. 1 · Type 2469/2430 K

Fig. 2 · Type 2478/2430 K

Type 2469/2430 K/2439 K Flow and Temperature Regulator and Safety Temperature Limiter (FR/TR/STL) · With Type 2469 Valve, Type 2430 K Control Thermostat and Type 2439 K Safety Thermostat

Principle of operation (see Figs. 3 to 6)

The regulators consist of a valve, actuator and a control thermostat (20) and, in some cases, also a safety thermostat (26/27).

Type 2468/2430 K Differential Pressure and Temperature Regulator

To control the differential pressure, the high pressure is transmitted to the lower diaphragm chamber of the actuator (6). The low pressure is applied over a hole in the valve body (1) to the low pressure side of the diaphragm (6.1). The resulting differential pressure is converted into a positioning force at the operating diaphragm and is used to move the plug stem (4) and the valve plug (3) according to the force of the springs (5). The temperature of the medium produces a pressure in the sensor proportional to the temperature measured. This pressure is transmitted to the positioning bellows (23) where it is converted into a positioning force. It is used to move the valve plug (3) according to the force of the springs (21) and the temperature set point adjusted. The largest signal is always used to actuate the valve.

An overload protection (excess pressure limiter) (16) in the actuator of Type 2468/2430 K protects seat and plug from overload during exceptional operating conditions that could lead to valve or plant damage.

Type 2469/2430 K Flow and Temperature Regulator

The high pressure upstream of the restriction (1.2) is transmitted to the high pressure side of the actuator (6) over the attached control line (11). The low pressure downstream of the restriction is applied to the low pressure side of the diaphragm (6.1) through a hole in the valve plug (3). The resulting differential pressure is converted into a positioning force at the operating diaphragm. This force is used to move the valve plug according to the force of the springs (5). The operation principle of the control thermostat (20) is the same as described for Type 2468/2430 K. The largest signal is always used to actuate the valve.

Type 2478/2430 K Differential Pressure and Temperature Regulator

The regulator is the same as Type 2468/2430 K. However, the valve body (1) has no hole to transmit the low pressure. Instead, the high pressure and low pressure are transmitted over control lines.

Type 2479/2430 K Differential Pressure and Temperature Regulator with Flow Limitation

This regulator is the same as Type 2469/2430 K, except it does not have the control line (11). Instead, the high pressure of the plant is transmitted over a control line to be attached on installing the regulator in the pipeline. The flow limitation is adjusted at the restriction (1.2).

An overload protection (excess pressure limiter) (16) in the actuator of Type 2479/2430 K protects seat and plug from overload during exceptional operating conditions that could lead to valve or plant damage.

- | | |
|---|---|
| 1 Valve body | 15 Coupling rod |
| 1.1 Connection nut with seal and welding end | 16 Internal excess pressure limiter (overload protection) |
| 1.2 Restriction for adjusting flow rate set point | 20 Control thermostat |

Fig. 3 · Type 2468/2430 K

Fig. 4 · Type 2469/2430 K

Type 2469/2430 K/2403 K Flow and Temperature Regulator and Safety Temperature Monitor

This regulator is the same as Type 2469/2430 K, but additionally has a Type 2403 K Safety Thermostat (26). When the temperature reaches the limit value adjusted, when the capillary tube ruptures or there is a leak in the sensor, a spring mechanism closes the valve. The valve automatically resets itself when the fault has been remedied and the temperature has fallen below the limit. The Type 2403 K Safety Thermostat is available in two versions which differ in their sensor installation position. Refer to Data Sheet T 2183 EN for more details.

Type 2469/2430 K/2439 K Flow and Temperature Regulator and Safety Temperature Limiter

This regulator is the same as Type 2469/2430 K, but additionally has a Type 2439 K Safety Thermostat (27). A spring mechanism closes and locks the valve when the temperature reaches the limit value adjusted, when the capillary tube ruptures or there is a leak in the sensor. The valve can only be reset and put back into operation with a tool.

Installation

The regulators are only suitable for installation in horizontal pipes

Valve

- The medium must flow through the valve in the direction indicated by the arrow on the valve body.
- The valve must be mounted suspended downwards.

Control thermostat

- The temperature sensor of Type 2430 K Control Thermostat and Type 2439 K Safety Thermostat may be installed in any position.
- The installation position of the temperature sensor of Type 2403 K Safety Thermostat must be carefully observed as it depends on the sensor version.

Fig. 5 · Type 2469/2430 K/2403 K Flow and Temperature Regulator and Safety Temperature Monitor

Fig. 6 · Type 2469/2430 K/2439 K Flow and Temperature Regulator and Safety Temperature Limiter

The following points must be observed:

- The whole length of the sensor must be immersed in the medium to be controlled.
- The sensor should be installed in a location where overheating or considerable idle times cannot occur.
- The capillary tube should be routed in such a way that the permissible temperature range is not exceeded, temperature fluctuations do not occur and the tube cannot be damaged.
- The smallest bending radius is 50 mm.

3) An increase in noise level can be expected when the specified flow rates are exceeded, even if cavitation does not occur.

4) The minimum required differential pressure ΔP_{min} across the valve is calculated as follows:

$$\Delta P_{\min} = \Delta P_{\text{restriction}} + \left(\frac{\dot{V}}{K_{vs}} \right)^2$$

Table 2 · Flow rate set point ranges for Type 2479/...
