

# Limit Switch for Rotary Actuators with Solenoid Valve

## Type 3775

### Application

Limit switch with incorporated inductive or electric limit switches for attachment to rotary actuators (part-turn) according to VDI/VDE 3845.

Can be equipped with a solenoid valve for converting electric binary signals into pneumatic binary control signals.

The limit switch supplies a limit signal when an adjusted limit value is exceeded in either direction, especially when a control valve has reached a final position.

This signal is suitable for reversing control signals, initiating visual or audible alarms and for connection to central control or alarm systems. The device can be equipped with a solenoid valve for converting binary signals from electric control units into powerful binary pressure signals which open or close an associated control valve.

The opening angle of the actuator is transmitted to the integral limit switches via a shaft with adjustable metal tags or cam disks. All limit switches can be overridden and can be optionally used as normally-opened or normally-closed contacts.

Excellent switching accuracy; no mutual influencing of the incorporated limit switches.

The input of the solenoid valve is designed for binary signals up to 24 V DC or 22 mA customarily used in open-loop control systems; low power consumption; maximum output of 6 bar.

### Versions

Type designation		3775-	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Explosion protection	Without	0				
	EEx ib II C T6	1				
	CSA/FM	3				
Solenoid valve, DC nominal signal for version	Without					0
	Non-Ex					1
	6 V					2
	12 V					3
	24 V					4
EEx ib II C T6 and CSA/FM	Without					0
	6 V					1
	12 V					2

Fig. 3 · Type 3775-11 Limit Switch with solenoid valve (without cover)

## Principle of operation

The shaft (2) of the limit switch is connected to the rotary actuator (part-turn) via the coupling lever (1). It is provided with up to three adjustable metal tags (21) or cam disks (23.1) and the position indicating disk (2.2).

### Version with inductive limit switches (Fig. 4)

With this version, the shaft (2) is provided with adjustable metal tags (21) for frictionless operation of the incorporated proximity switches (22). These become highly resistive when the metal tag is within the inductive field (logic function: contact opened), whereas they become low-ohmic when the metal tag is outside the field (logic function: contact closed).

Plate springs couple the shaft (2) to the manually adjustable metal tags (21). The position of these tags determines the logic function and the switching point. For operation of the inductive limit switches, appropriate signal converters (transistor relays) must be connected in the output circuit.

### Version with electric limit switches (Figs. 5 and 6)

With these devices, the shaft (2) is provided with up to three switch cases (23) containing adjustable cam disks (23.1). Each cam disk actuates an electric double-throw switch (24) by means of the roller mounted to the switch lever (24.1). The switching function and the limit value are steplessly adjustable by means of an adjustment screw.

### Version with solenoid valve (Fig. 7)

By means of the solenoid valve, electric DC voltage signals of 6, 7.5, 12 or 24 V or a load-independent current signal of 22 mA are converted into a pneumatic binary control signal (on/off) in the range from 0 to 6 bar (0 to 90 psi).

Required supply air pressure: 1.4 to 6 bar (20 to 90 psi).

Depending on the type of valve attached, the following versions are available:

**Logic function 1** (Fig. 7.1) · With one 3/2-way valve  
Normal position: Output vented ( $p_A = 0$  bar)

**Logic function 2** (Fig. 7.2) · With one 3/2-way valve  
Normal position: Supply air through-connected ( $p_A$  to 6 bar)

**Logic function 4** (Fig. 7.3) · With two 3/2-way valves  
Normal position: One output vented ( $p_{A1} = 0$  bar) and one output with the supply air through-connected ( $p_{A2}$  to 6 bar)

The logic functions 1 and 2 are suitable for single-acting rotary actuators (e.g. SAMSON Type 3278), and logic function 4 is suitable for double-acting rotary actuators.

## Materials

Body	Die-cast aluminium, plastic-coated
Diaphragm	NBR (acrylonitrile butadiene rubber)
Control piston	CuZn 40 Pb2, WN 2.0402 with NBR gaskets
Coupling lever	Stainless steel WN 1.4571
Shaft	Stainless steel WN 1.4301
